California coastal grasslands

- 🌻 Unique summertime fog
- 🌻 Dominated by perennials and annual forbs
- 🌻 High species diversity

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Ford and Hayes, 2007; Keeler-Wolf et al. 2007

✉ Justin.Luong@
Humboldt.edu
🐦 @JustinCLuong

Perennialization = increased dominance & abundance of perennial species

Lesage, Howard, Holl 2018
Holl, Luong, Brancalion 2022

Biotic homogenization = increased dominance by a few select species

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Variability in restoration outcomes

- 🌻 Grassland restoration outcomes are relatively unknown
- 🌻 For few projects resurveyed, outcomes are variable
- 🌻 Lack of funding leads to limitations during initial site assessments

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Suding 2011; Adler et al. 2013; Brudvig et al. 2017

Restoration management

- 🌻 Management practices can greatly differ depending on agency
- 🌻 Practices may differ because project goals differ
- 🌻 There are limited sources of funding for restoration

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Holl and Howarth 2000; Clewell and Aronson 2006
Rowe 2010; Homewood et al. 2001

Research Questions

1. Does coastal grassland restoration meet project-based goals and a standard performance metric?
2. Is native cover related to project age?
3. What are the biggest barriers to achieving restoration goals?
4. How does funding and maintenance influence outcomes?

Restoration project selection

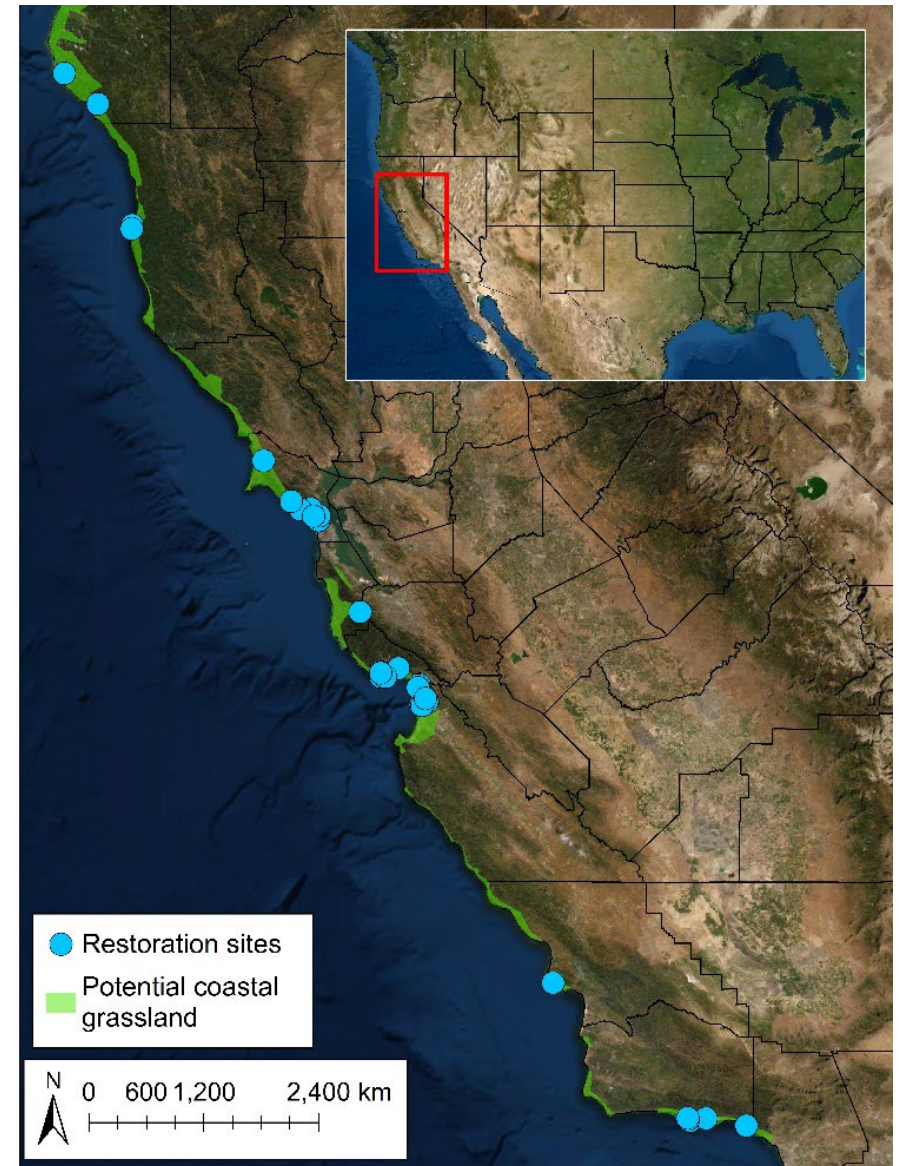

- 🌻 1000-km N-S gradient
- 🌻 Identified 37 projects (of 48 possible)

Selection Criteria:

1. At least 3 years post-planting or -seeding
2. Size ≥ 1 acre
3. Coastal grassland

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Field Surveys (2019-2021)

🌻 Used 0.25 m² quadrats every 5-m along 50-m transects

🌻 3 – 16 transects, scaled to site size (1-32 acre)

🌻 Estimated absolute cover of all plants

🌻 Collected 3 soil samples per transect in 2019

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Semi-structured interviews and Document analysis

🌻 Reviewed project documents prior to vegetation surveys

🌻 Projects with documents = 63%

🌻 Interviewed one or more practitioner from each site

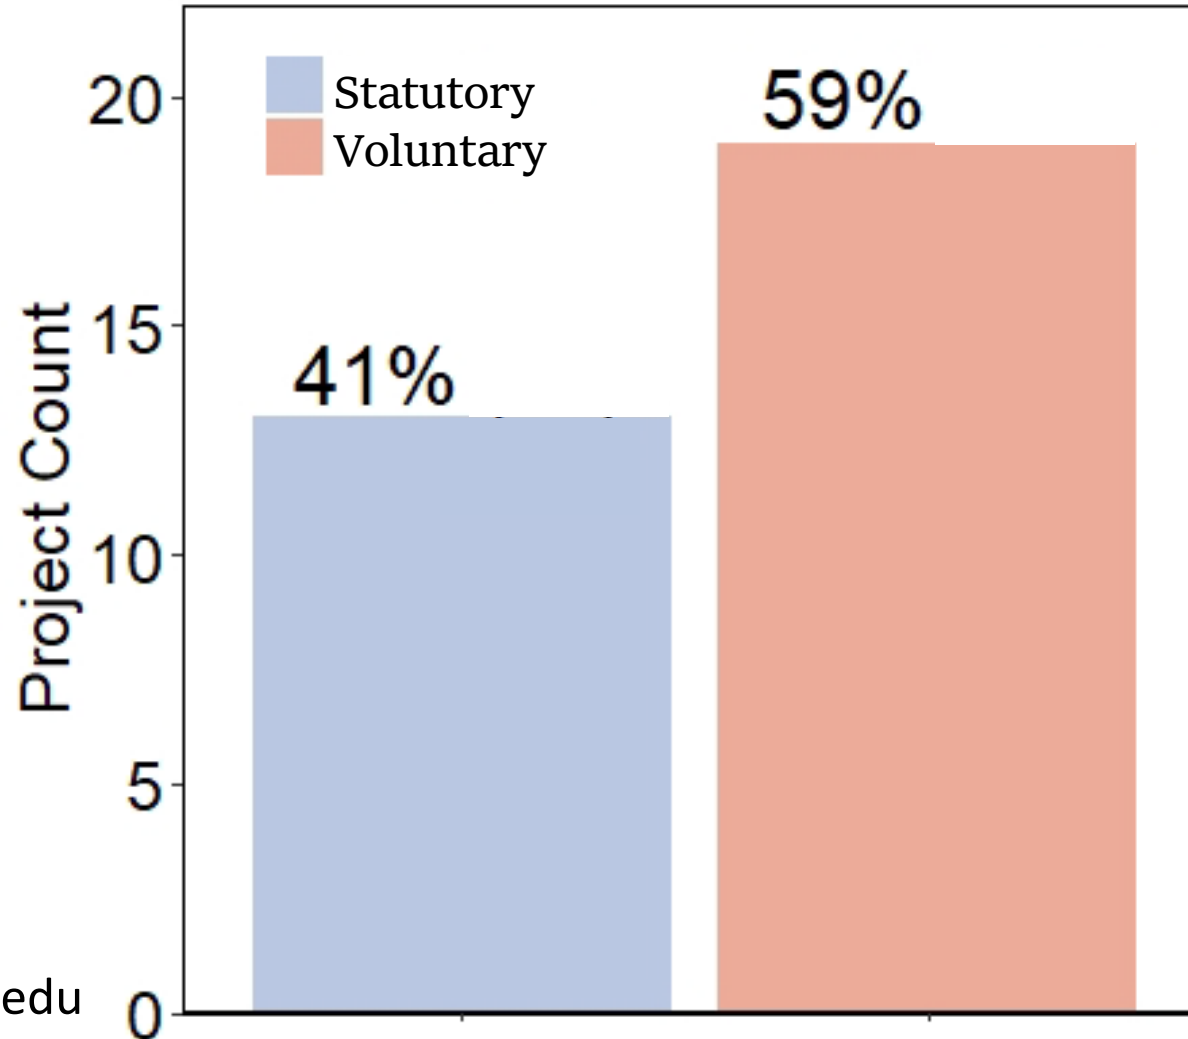

🌻 Focused on resources and barriers to achieving goals, and implementation strategies

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Barriers to achieving restoration goals

- 🌻 Invasive species management = 100%
- 🌻 Funding levels = 84%
 - 🌻 Post-implementation monitoring = 20/27 (74%)
- 🌻 Sourcing appropriate and sufficient plant material* = 34%

Restoration is largely successful at reaching project goals

Standard performance metric:

25% native cover and 6 native species after 5 years

Project-based goals:

Varied directional goals, focused on increasing native cover or decreasing non-native cover or erosion

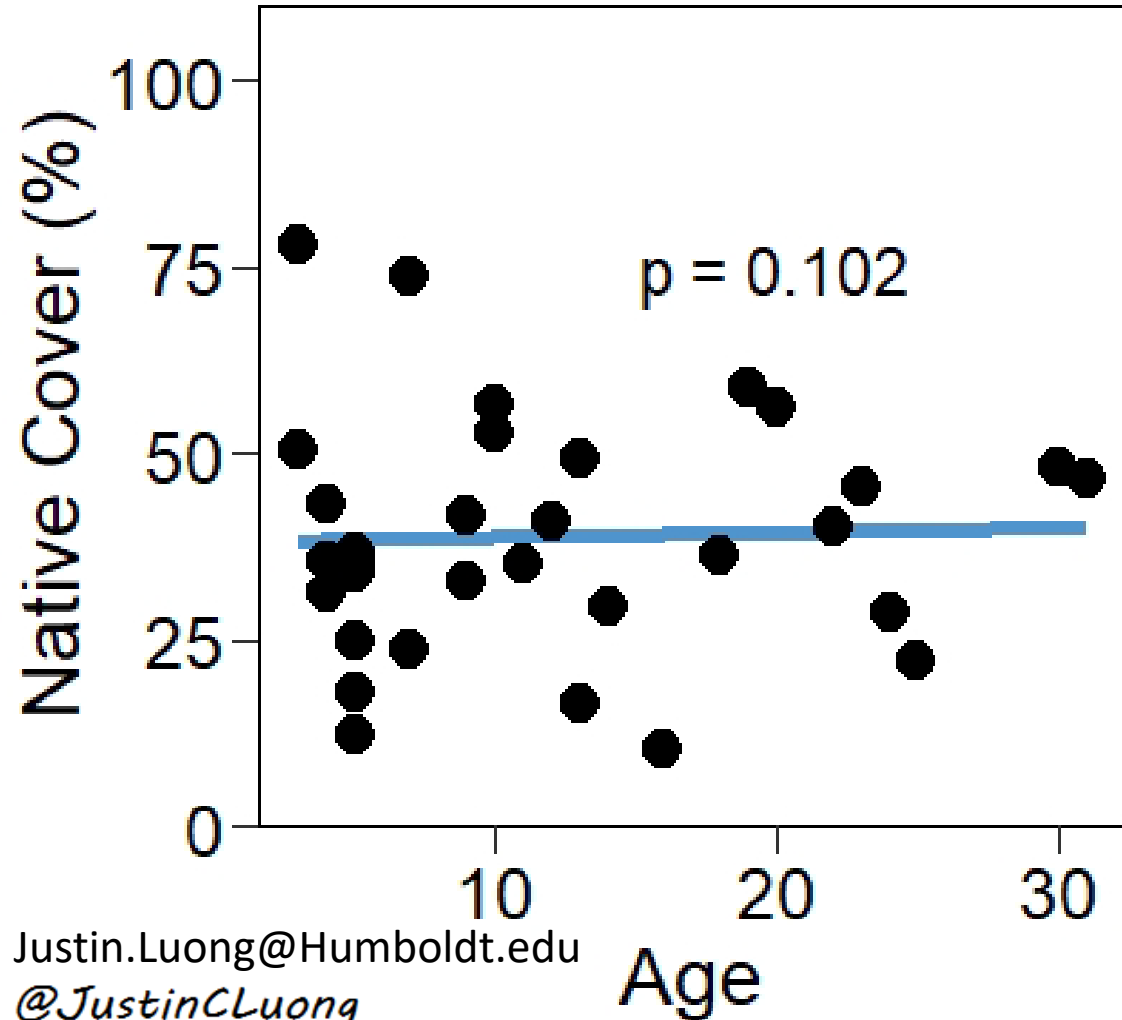

Standard performance metric outcomes

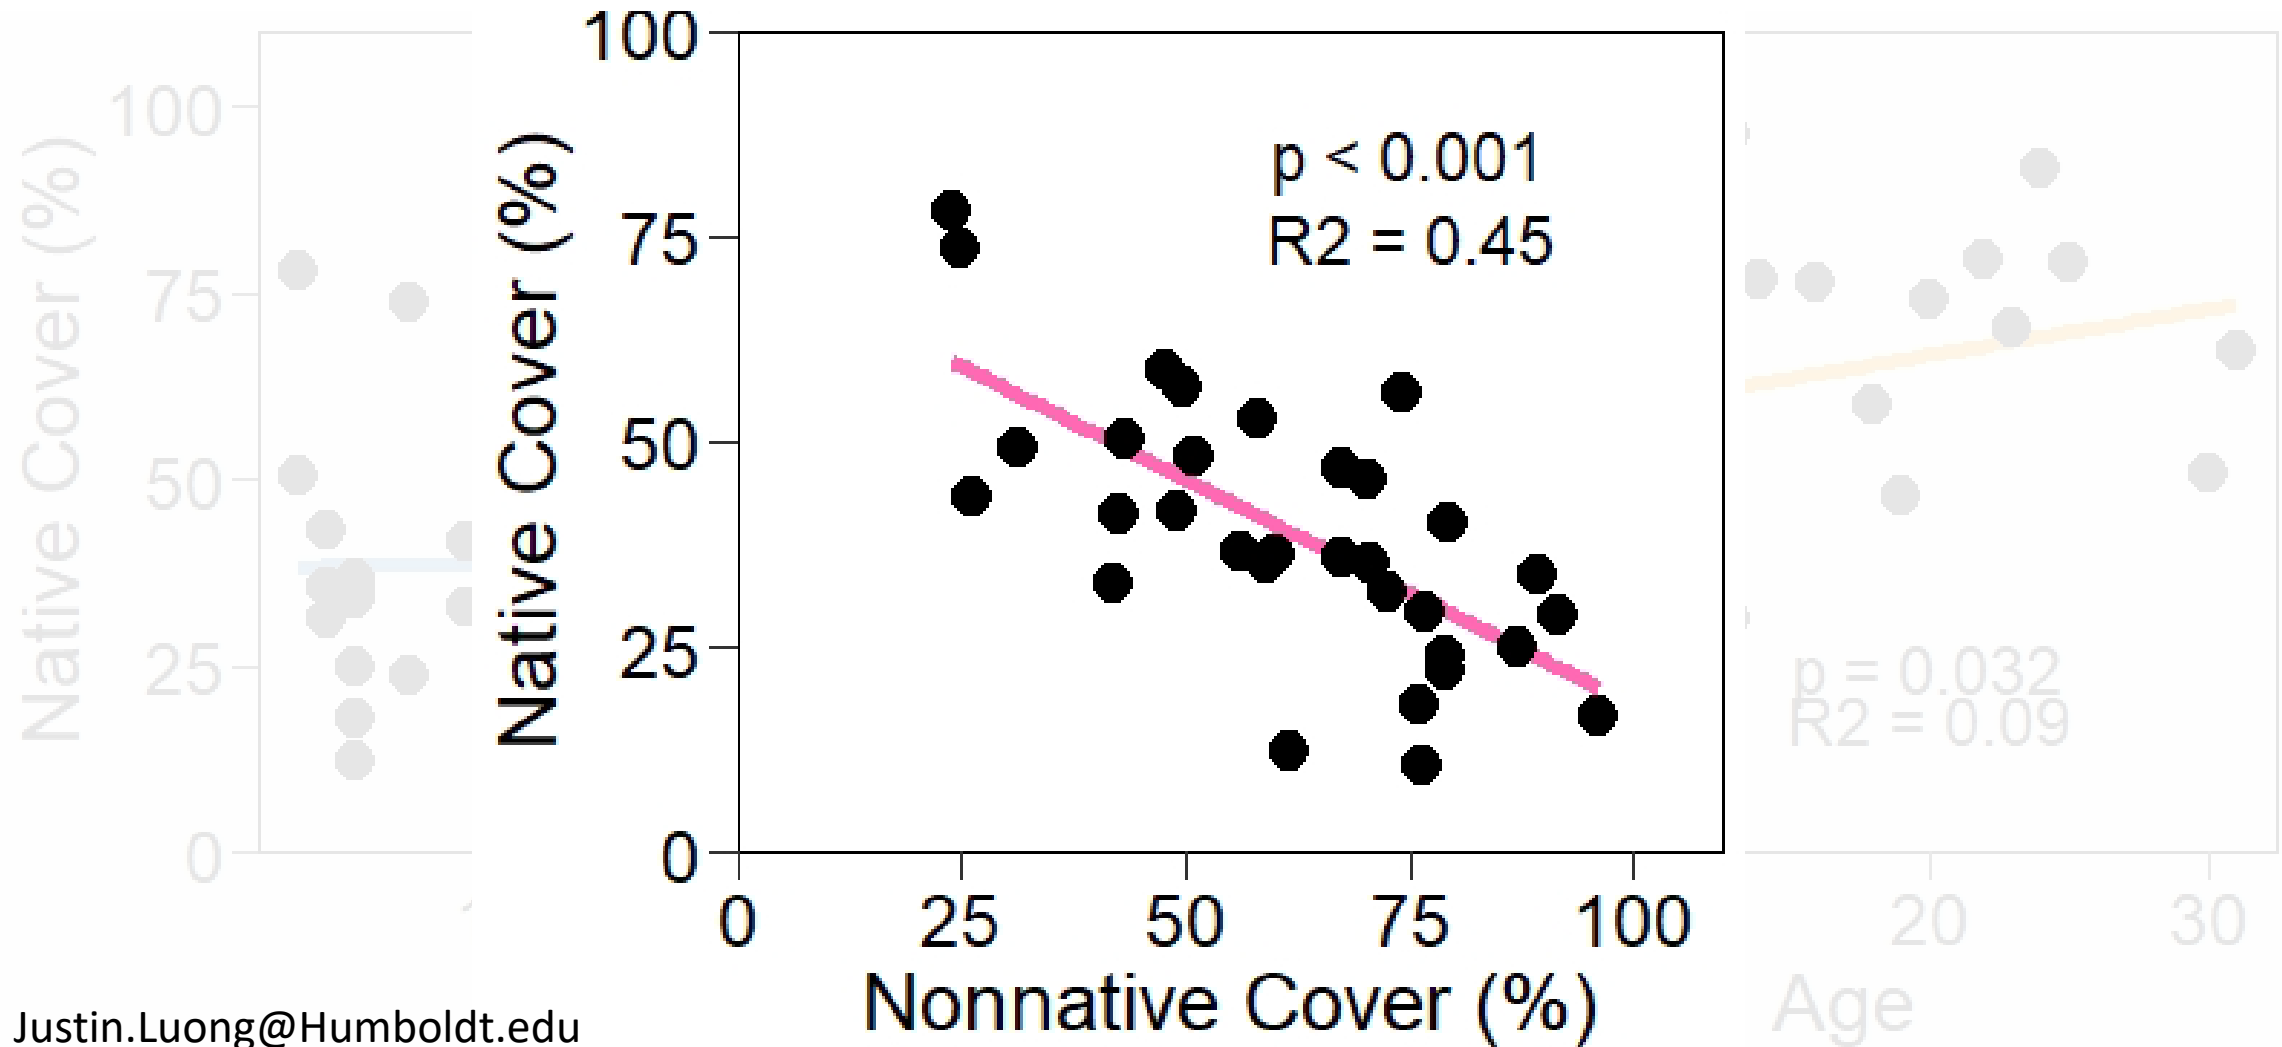

Plant cover is relatively stable with project age

🌻 Native cover range = 13% to 79%

🌻 Native richness range = 5 to 60

Non-native competition strongly impacts restoration efforts

✉ Justin.Luong@Humboldt.edu

🐦 @JustinCLuong

Native species richness per hectare is negatively associated nonnative plant cover

Regional biotic homogenization

🌻 88% of projects use species because they survive better or grow faster

	N1	N2	N3	N4	N5	N6	N7	N8	N9	N10	N11	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10	C11	C12	C13	C14	C15	S1	S2
<i>Stipa pulchra</i> (69%)	X	X	X	X	X	X	X	X	X			X	X	X				X	X	X	X	X	X	X	X		X	X
<i>Elymus glaucus</i> (59%)	X	X	X	X	X	X	X	X	X			X	X	X				X		X	X		X	X	X	X		
<i>Bromus carinatus</i> (50%)	X	X	X	X	X	X	X	X	X						X	X	X	X	X				X	X				
<i>Hordeum brachyantherum</i> (44%)											X	X	X	X	X					X	X	X	X	X	X	X	X	X
<i>Festuca rubra</i> (31%)			X	X	X	X	X	X	X						X	X	X											
<i>Achillea millefolium</i> (22%)			X		X	X	X	X	X																	X		
<i>Danthonia californica*</i> (22%)	X	X	X	X	X	X	X	X	X	X	X																	
<i>Deschampsia caespitosa</i> (17%)	X	X		X						X	X																	

Financial cost has no direct effect on plant metrics, but higher maintenance intensity improve biodiversity

Using more species can counter homogenization but is associated with greater costs

Summary: Grassland restoration is largely successful

- 🌻 Successful at achieving project-based goals and standard metric
- 🌻 Invasive species limit success
- 🌻 Projects indicate that they would have done more if possible

Summary: Obstacles to increasing regional diversity

- 🌸 Difficulty in sourcing appropriate plant material and using new species
- 🌸 Risk aversion in achieving restoration goals

CALIFORNIA COASTAL GRASSLAND RESTORATION

is Successful

BUT MAY PROMOTE BIOTIC HOMOGENIZATION
